Number of Bedrooms: ___ Existing ___ Proposed ___ Total

Existing Septic Tank Size: _____ gallons Ex. Pump Chamber Size: _____

Existing type of Absorption Treatment:
Trenches ___ Drywells ___ Gallery ___ Bed ___ Other _____

Applicant's Signature _____ Phone # _____

.....

For subdivision testing, a map of the property must be submitted with the application. A **minimum** of 6 deep test holes per lot (three in primary, three in reserve- make sure you have down gradient holes) and two percolation test holes (one primary, one reserve) are required. Deep test holes should be spaced adequately apart for proposed size of septic system. If a property has an existing house and a proposal is made to change existing property lines to create a new lot or lots, a reserve septic area must be validated. This will require a **minimum** of four deep test holes (spaced adequately apart) and two percolation tests per lot.
